## ANNUAL CHARITY QUIZ

at the Bridgehouse Pub

Just a wonderful evening at our annual charity quiz. An amazing turnout and we raised £2000 for EHE Rare Cancer

EHE can be slow growing and may be characterised by slow tumour growth and mild symptoms.

We can't thank you enough for coming along, donating prizes and supporting us, supporting this vital charity.

Some patients have no symptoms for years. Rarely, EHE can even go into spontaneous remission. So, newly diagnosed EHE patients usually have time to learn about the disease, find an expert, get second opinions and decide what to do.

*A rare vascular sarcoma cancer that affects women more than men, and is particularly aggressive in young adults and children.*

### **What is EHE?**

Haemangioendothelioma (HE) is the name for a group of very rare vascular cancers involving cells that line the inside of blood vessels (endothelial cells). Vascular cancers account for only a fraction of 1% of all cancers. 'Epithelioid' refers to the elongated shape of the cells when seen under the microscope. Tumours can involve liver, lung, bone, lymph node, skin and other soft tissues, and they can occur simultaneously at multiple sites. EHE occurs in people of either sex and of any age.
